
W.T.F.D.A. TV STATION GUIDE

2005 EDITION

CHANNEL MAPS
TV STATION LISTS

For United States, Canada & Mexico

Welcome to the 2005 Edition of the Worldwide TV-FM DX Association's TV Station Guide. This publication was prepared by and for TV "DXers" - hobbyists interested in the unusual long-distance reception of TV signals. We believe this *Guide* is the most complete reference available to low-power stations, Class A stations, and TV translators in the United States. We also believe it to be the most complete available reference to Canadian stations. (including low-power and repeater transmitters) Finally, this *Guide* contains extensive listings of Mexican TV stations, not available in most other station guides.

Technical information comes from the websites of the U.S., Canadian, and Mexican governments:

http://www.fcc.gov
http://spectrum.ic.gc.ca/engineering/engdoc/baserad.zip
http://dgsrt.sct.gob.mx/fileadmin/ligas/tv_internet.pdf

Additional Mexican information comes from the official websites of the Televisa and TV Azteca networks

Programming information comes from reports from WTFDA members; readers of previous editions of this *Guide*; my personal observations; and the websites of the various TV networks. Your information is much appreciated! Please send any updates to Doug Smith at the address below. Thanks!

Contents of the Guide:

This *Guide* contains two main sections.

First, you will find 68 maps. Each map shows the locations of most[1] stations on a given TV channel. The location of a station's tower is marked with a:

Δ - full-power analog stations
■ - full-power digital stations
♦ - low-power stations

For full-power stations, the tower location is labeled with the call letters[2]. The letters are followed by a character indicating the station's frequency offset, and then by a letter indicating the network affiliation.

---

1 To keep the maps large enough for reasonable detail, it was necessary to cut off Alaska, Hawaii, and northern Canada.

2 There isn't enough room to mark low-power tower sites. I tried; on the channel 2 map, western Colorado was one black blob...

Again, these marks indicate the site of the station's transmitting tower. This may be located in a different community, or even a different state, from the community with which the station identifies itself. For example, close examination of the channel 2 map will show WGRZ is located somewhat to the east of Buffalo, the city with which the station is associated; KTVU may officially be an Oakland, California station, but the transmitter (and the mark on the map) is in San Francisco.

In Mexico, it was often necessary to remove the call letter labels from full-power tower sites to maintain legibility. An effort was made to retain the labels for the most powerful, most often-DXed stations.

In some cases, a TV station has applied to move its transmitter to a new site, or has been granted permission to do so. In these cases, two tower site marks may appear nearby on the map. Only one will be labeled with the call letters. You'll have to refer to the text listings to determine the status of the sites.

The second major portion of the *Guide* is the text listings. There are a series of pages for each channel. Within each channel, sections of the listings are:

- USA full-power stations.
- Canadian full-power stations.
- Mexican full-power stations.
- USA DTV channel change requests.
- USA DTV stations.
- USA Class A, LPTV, and translator stations.
- Canadian LPTV stations.
- Mexican LPTV stations.

Within a section, listings are ordered first by state/province, then by city, then by operational status. Full-power analog stations are marked in **boldface**, full-power digital stations in ***bold italics***, and low-power stations in regular type. <u>Underlined</u> entries are emergency backup transmitters.

Looking at the first three listings on channel 2...

```
Anchorage, AK   KTUU-TV  100. 219.   - H   612522 1495220 LIC  NBC
Fairbanks, AK   KATN      26.7 218.  +dH   645520 1474249 CP   KIMO (13 ABC)
Fairbanks, AK   KATN      28.2 12.0  + H   645042 1474252 LIC  KIMO (13 ABC)
```

The first station is licensed to serve Anchorage, Alaska. The transmitter may be elsewhere. The government-assigned call letters are KTUU-TV. In the U.S., stations are required to announce these letters and the city they're licensed to serve once an hour, as close to the top of the hour as possible. Violations are not unheard of.

KTUU-TV is authorized an effective radiated power of 100 kilowatts. This figure takes into account the ability of the station's transmitting antenna to concentrate power along the horizon. The output power of the KTUU-TV transmitter may be closer to 25 kilowatts, but the antenna prevents this power from shooting out into space where it does no good. (the astronauts on the Space Station don't get ratings books <grin>!)

Some low-power stations may have a blank in the power field. These stations use less than five watts of power.

KTUU's transmitting antenna is 219 meters above average terrain. "Average terrain" is computed by drawing a line, 16 kilometers (10 miles) in length, on a topographic map. This line goes straight north from the base of the tower. The elevation above sea level of the point 3 kilometers (2 miles) from the tower is noted, and the elevation of points every two kilometers further is also noted. Then, another line is drawn 45° east of north, and the elevation of that line noted. The process continues until lines are drawn all the way around the tower.

Now, the elevations of all the measured points are averaged. This is the elevation of average terrain, above sea level, surrounding the station's tower. This figure is subtracted from the elevation above sea level of the center of the station's antenna. That difference is the station's "height above average terrain", the figure that appears in this *Guide*.

Some stations have unusually low (or even negative) antenna heights. Note the second record for KATN above, or the negative figure for KHBC-TV in Hilo, Hawaii. Usually, these stations are located in valleys. KHBC's antenna is atop a hotel in downtown Hilo, on the east side of a volcano. The negative figure means the KHBC antenna is actually <u>lower</u> than the average of surrounding ground.

Exceptionally high antennas usually mean the tower is atop a mountain. KCBS-TV Los Angeles, 1097m above average terrain, is atop Mt. Wilson. The KCBS tower is only 285m tall; the remaining 812m of antenna height is provided by the mountain.

Following the tower height is the station's channel offset. KTUU-TV is on negative offset – it operates 10KHz below the nominal frequency for channel 2. KATN is on positive offset, operating 10KHz <u>above</u> channel 2. This practice makes mutual interference between the stations less bothersome. "Z" means zero offset – the station operates on the nominal channel frequency. Low-power stations may be listed with "N", or "no", offset. These stations are assigned to the same frequency as zero offset, but have a looser frequency tolerance. They may drift considerably, possibly going below minus offset or above plus. No-offset stations have a greater possibility of causing annoying interference, and thus must be located further from other stations on the same channel than would be necessary if they operated with zero, plus, or minus offset.

Next is an indication of whether the station uses a directional antenna. If a 'd' appears in this column, the antenna is directional; if not, the station is omnidirectional. The first record for KATN is for a directional antenna.

After the directional antenna indicator is the station's polarization. In the USA, stations are required to use horizontal polarization, - H - but may optionally use circular polarization – C – or elliptical – E. Where this column is blank, you should assume horizontal polarization.

Now, you find two rather cryptic numbers. These are the geographic coordinates of the transmitting tower. KTUU-TV is at 61°25'22"N, 149°52'20"W. Again, these coordinates are those of the transmitting tower. They may not be within the listed city, and the studios and offices may not be at this location.

These coordinates are unknown for most Mexican stations. The U.S. FCC does have records of the coordinates of Mexican AM stations, used for ensuring U.S. AM frequency assignments don't interfere with Mexican stations and vice-versa. Where no coordinates are available for a Mexican TV station, you will see the coordinates of an AM station in the same city. This is obviously not completely accurate, but it's better than nothing. Mexican stations close to the USA border are more likely to have accurate coordinates listed. Where these fields are blank, no coordinates could be found either for the TV station itself or any AM station in the same city.

After the coordinates is an indication of the status of the station.

In the USA, a station begins with status **APP** – application. This status may indicate an application for a completely new station[3], or an application to change the technical parameters of an existing station. The FCC (or usually, its staff) rules on each application, either dismissing it (in which case it disappears from the database) or granting it, in which case the status changes to **CP** – Construction Permit.

A construction permit is a kind of guarantee, that if you build the station the way you said you would in your application, a license will be granted. Before the station can advance to the final stage – **LIC** – Licensed – the transmitting equipment must be tested. It must be shown that the station's coverage is as predicted; that there is not unexpected interference; and that it provides a signal of reasonable quality.

A station that holds a construction permit may request "program test authority". This authority allows the station to begin regular broadcasts while awaiting action on their application for a permanent license. Such authority is not listed in the FCC Database. Usually, only a few weeks pass between the receipt of program test authority and FCC action on the permanent license. However, on occasion a station may wait for years for a regular license.

---

3 Because of the enormous number of such applications on file, and the fact that the vast majority will be denied, new-station applications are not listed in the *Guide*.

What the above two paragraphs mean... is that stations that have the status CP – that hold a construction permit, but no license – may legally be on the air. They may be testing the transmitting equipment, or they may begin regular broadcasts under program test authority.

Two other statuses are possible for USA records. **GRA** appears for applications to change the channel assignment of a digital station. It means the channel change request has been granted. **STA** means Special Temporary Authority. The station has special authority to operate at a power level, and/or on a channel, different from that specified in the license/permit. The vast majority of STA records are for digital stations to operate at powers lower than authorized. For example, the permit of WETM-DT on channel 2 in Elmira, New York calls for a power of 10,000 watts. WETM also holds a STA to operate temporarily at only 270 watts.

Where a station holds both a STA and a CP, the station is probably operating with the STA facilities. However, this can change with little notice. Where both a STA and a LIC record appear, the STA has been superceded by the licensed facilities.

Different terminology is used outside the United States. Most Canadian stations are listed with a status of **OP**, which means the station is operational. A few are listed as **AU**, authorized but not yet on the air. As with USA stations of status CP, you can expect these authorized stations to appear at any time. A few stations may appear with status **TO** or **SD**; these are temporary stations.

Most Mexican stations are listed as **XLI**. A few appear in SCT government records as under construction, and are listed here as **XCP**. Such listings should not be considered complete; some Mexican stations listed as XLI may not yet be on the air.

The final entry in each station's record is the programming source. KTUU-TV is affiliated with the NBC network. (networks are listed below) Where the call letters of some other station appear in the programming field, that station is relayed. KATN in Fairbanks relays KIMO Anchorage; KIMO is on channel 13 and is an ABC affiliate.

Where more than one programming source appears for a station, that station carries different networks at different times. KQTV-2 in Missouri carries both ABC and Fox programs. Usually, most programs are carried from the network that's listed first, and often programs from the other networks are aired at the "wrong" time.

Digital TV stations are capable of broadcasting more than one program at the same time. When these additional networks are known, they're listed in the programming column. For example, WISC-DT channel 50 in Wisconsin carries CBS on one digital program, and UPN on another. Most digital affiliates of the Pax network carry between four and six sub channels (including a Pax feed from the opposite coast and the Worship and Praise religious networks) Many PBS and

TBN stations also carry multiple programs. Many ABC stations carry "ABC News Now", an all-news channel; and NBC is launching a similar all-weather network.

Weirdnesses:

You may find some things on the air that don't make sense when compared to this *Guide*. There are several possible reasons.

The television dial is continually changing. At this time, the FCC has a "freeze" on applications for new full-power TV stations. However, there are a number of older applications "in the pipeline" which have not yet been acted on. It is possible the FCC will approve some of these applications, and that one or more of these new TV stations will appear on the air.

Many LPTV stations are being displaced from channels 52-69. This edition of the *Guide* should reflect the vast majority of LPTV displacements, but some remain to be resolved. There have been quite a few changes in DTV channel assignments, and there will likely be more after this *Guide* goes to press.

There has been a considerable increase in the number of DTV-only stations. Some of these are among the older applications "in the pipeline" at the beginning of the DTV transition. When granted, these stations didn't get a second channel for digital operation. They're required to choose to operate as either analog or digital; they cannot operate both simultaneously. Some of these stations (WCAV-19 Virginia; WBIH-29 Alabama) have chosen to sign on as analog stations. Others (WTLF-24 Florida; WMAK-7 Tennessee) have chosen to sign on as digital.

A few stations that used to operate analog transmitters have chosen to shut down the analog transmitters and operate digital-only. WNVT-DT in Northern Virginia chose not to repair their channel 53 analog transmitter after a major failure, becoming a DTV-only station on channel 30. KCSM-DT in San Mateo, California lost the lease on the tower for their channel 60 analog transmitter. They decided to remove the analog transmitter and operate from their separate digital site as a DTV-only station on channel 43. You may expect more stations to close their analog operations and become DTV only.

A number of TV translators are known to operate under special temporary authority. Often, these STAs don't appear in the FCC database, and thus don't appear here. I believe the STA translators of KQDS-21 Duluth (located across northern Wisconsin and Minnesota) all now hold regular permits and appear in this database. There are reports of additional STA translators in eastern South Dakota and western North Dakota.

Some stations have been known to "disappear" from the FCC's records. Channel 18 in Elizabeth City, North Carolina is a good example.

If you're not a member of the Worldwide TV-FM DX Association, you may wish to consider joining. The monthly *VHF-UHF Digest* will keep this Guide updated. It will also keep you up to date with other developments in the world of TV technology. You'll also get information on FM radio, as well as the latest on long-distance FM/TV reception.

Dues are $24/year in the USA, US$26 to Canada. A $10/year membership is available with electronic delivery of the *VHF-UHF Digest*. For more information, visit:

http://www.anarc.org/wtfda

To join the WTFDA, visit:

http://fmdx.usclargo.com/join.html

or send a check for US$24 to:

Mike Bugaj
P.O. Box 501
Somersville, CT 06072

If you have any questions, comments, or updates for this guide, please contact:
